

Application Guidelines

Field Construction or Renovation

Rate of Application:

As determined by testing of existing soil and/or as directed by Landscape Architect or Turf Consultant, either 1" or 2" application.

1" application = 3.1 cubic yards per 1,000 SF
(135 cubic yards per acre)

2" application = 6.2 cubic yards per 1,000 SF
(270 cubic yards per acre)

Method of Application:

Recommend incorporating into existing soil to a depth of 4-5 inches for a 1" application or 7-8 inches for a 2" application, resulting in an inclusion rate of approximately 15% - 25% by volume.

Enhancement of Existing Turf

Rate of Application:

As determined by Landscape Architect or Turf Consultant, either 1/4" or 1/8" application.

1/4" application = 0.75 cubic yards per 1,000 SF
(34 cubic yards per acre)

1/8" application = 0.375 cubic yards per 1,000 SF
(17 cubic yards per acre)

Method of Application:

Recommend aggressive core aeration immediately prior or immediately following application. Incorporate into soil by mat dragging to effectively break-up cores and work the mixture into voids from core aeration. Most productive results when performed during cool, moist seasons when turfgrass is actively growing. Top dressing application may be combined with overseeding or slit seeding.

DIAMOND-GRO PRODUCTS...

- Are stored indoors so your product is protected from the elements and arrives at your location in prime condition ready for quick and efficient installation.
- Can be blended to meet your desired mix ratio.
- Leave no residual traces. So after installation, hands and tools can be cleaned easily.
- Are available for pick-up at our Narvon, PA facility or can be delivered to your site by our fleet of professional drivers.

The Professional's Choice: Diamond-Gro™ Turf Topdressing Products

Compost

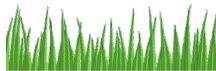

Diamond-Gro™ Compost is produced specifically for use as a turf top dressing and a component in the construction of root zones. Compost is ideally

suitable for incorporation into native soil for the purpose of increasing organic matter and beneficial microbial populations in the root zone, thereby improving soil quality and turfgrass establishment and growth.

Diamond-Gro™ Compost is a thoroughly composted, stable, mature and weed-free organic product. Our compost material is derived from organic sources including horse and dairy manure, wood shavings, sawdust livestock bedding, straw, hay, and other agricultural components.

Diamond-Gro™ Compost contains no municipal solid waste, biosolids, spent mushroom soil, or any substances toxic to plants.

Custom Soil Blends

Perfect For Landscape Planting Needs!

Whether your field is native soil or sand-based, we are able to custom-blend compost, topsoil and sand *at your desired ratio* to meet most specifications for root zone and top-dressing mixes.

Custom Soil Blends are also a valuable addition for landscapers, providing a

nutrient-rich base to help establish new plantings.

Your custom-blended soils are protected from inclement weather and are ready to spread immediately upon arrival.

Clean natural sand, agricultural organic compost and 3/8" screened topsoil insure that your blend is mixed using only the finest quality ingredients, maximizing the effectiveness and the efficiency of your application.

Screened Topsoil

Carefully screened to 3/8" sieve, this high-quality topsoil is designed for athletic fields. But it can also be used for a variety of landscape projects and any application where clean and consistently screened topsoil is required.

Diamond-Gro™ Screened Topsoil is also the topsoil of choice for our Custom Soil Blends for topdressing applications on lawns and athletic fields (which require maximum growth performance and safety).

Our consistently-screened topsoil prevents sharp and dangerous materials from infiltrating the final product and you receive a safe and productive medium for fast and healthy plant propagation.

1" Minus Topsoil

An intermediate topsoil fill that is ideal for locations where a coarser material is needed. Screened at 1" maximum sizing eliminates any large rocks and contamination, leaving only

those materials suitable for planting grass and/or plantings that don't require a base soil profile of finely screened material (such as common areas, landscape beds, sod, roadsides, etc.). 1" minus gives you a lower cost alternative to finely screened topsoil where its application is acceptable.
